

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

News Forge

The domain of the Project: Artificial Intelligence
COURSE NAME: Gen AI

Team Mentors (and their designation):
Mr. Prujith Radhakrishnan – Gen AI Faculty

Team Members:
Mr. Prasanna T

Period of the project

JAN 2026 to JULY 2026

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

Declaration

The project titled “NEWS_FORGE” has been mentored by Mr. Prujith Radhakrishnan Sir, organised by SURE Trust, from April 2023 to August 2023, for the benefit of the educated unemployed rural youth for gaining hands-on experience in working on industry relevant projects that would take them closer to the prospective employer. I declare that to the best of my knowledge the members of the team mentioned below, have worked on it successfully and enhanced their practical knowledge in the domain.

Team Member:

Mr. Prasanna T

Executive Summary

News Forge – AI Newsletter Engine is an AI-powered application designed to solve the problem of information overload in the rapidly evolving field of Artificial Intelligence. Every day, developers, researchers, startup founders, and students must monitor numerous websites, research papers, blogs, and social media platforms to stay updated with the latest AI advancements. This manual process is time-consuming, often requiring several hours each day. The objective of this project is to automate the entire news discovery and summarization process, enabling users to receive a concise, high-quality newsletter within minutes.

The project is developed using **Python** and the **PocketFlow** framework, which organizes the workflow into a modular pipeline. It integrates **DuckDuckGo Search (DDGS)** for real-time web search, **Google Gemini/OpenAI Large Language Models (LLMs)** for intelligent story selection and summarization, and **PyYAML** for structured data processing. The system searches multiple AI-related topics, filters duplicate or irrelevant news using a history-tracking mechanism, generates easy-to-understand summaries, and formats the final output into a professional newsletter.

The implementation demonstrates that AI-driven automation can significantly reduce the time required to stay informed while improving the quality and relevance of the information presented. The generated newsletter contains only the most impactful and recent AI developments, allowing users to focus on meaningful insights instead of spending hours searching through multiple sources.

From an industry perspective, the project highlights the practical use of **Generative AI, workflow automation, and intelligent information retrieval** in solving real-world problems. It provides value to professionals, students, researchers, and organizations that require quick access to reliable technology updates.

Key recommendations for future enhancement include adding personalized topic preferences, email and PDF newsletter delivery, semantic duplicate detection, user authentication, scheduled newsletter generation, analytics dashboards, and support for multiple news categories beyond Artificial Intelligence. These improvements would make the platform more scalable, user-friendly, and suitable for deployment as a commercial AI-powered news aggregation service.

Introduction

Introduction

Background and Context of the Project

Artificial Intelligence is one of the fastest-growing technology domains, with new research papers, frameworks, tools, funding announcements, and model releases appearing every day. Professionals such as software developers, AI researchers, startup founders, students, and product managers need to stay updated to remain competitive. However, the sheer volume of information available across news websites, research portals, blogs, and social media makes it difficult to identify the most relevant and valuable updates. As a result, users spend several hours every day searching, reading, and filtering information manually.

News Forge – AI Newsletter Engine was developed to address this challenge by automating the process of collecting, filtering, summarizing, and presenting the latest AI news in a structured newsletter. The system leverages Artificial Intelligence and workflow automation to deliver concise, high-quality updates from multiple online sources within minutes.

Problem Statement and Goals of the Project

Problem Statement

The AI industry generates an overwhelming amount of information every day. Existing news aggregators display raw headlines without meaningful analysis, while traditional newsletters are published on fixed schedules and offer limited customization. Consequently, users spend **2–4 hours daily** browsing multiple platforms to identify important developments, reducing productivity and increasing the chances of missing critical updates.

Project Goals

The primary goals of the project are to:

Automate the collection of real-time AI news from multiple online sources.

Filter duplicate and less relevant stories using intelligent selection techniques.

Generate concise and meaningful summaries using Large Language Models (LLMs).

Produce a professional AI newsletter in a structured format.

Reduce manual effort while improving the quality and relevance of information delivered to users.

Scope and Limitations of the Project

Scope

The project focuses on automating AI news aggregation and newsletter generation using modern AI technologies. It provides:

Live web search for AI-related news.

AI-powered story filtering and summarization.

Automatic removal of previously covered stories.

Generation of a clean and readable newsletter.

Support for customizable news topics.

A modular architecture that can be extended with additional features.

Limitations

Although functional, the current version has several limitations:

The system currently focuses only on AI and technology-related news.

News is displayed as a Markdown newsletter and is not directly delivered through email or mobile applications.

Duplicate detection is based on URLs rather than semantic similarity.

The project depends on internet connectivity and external LLM APIs.

Personalized user accounts and recommendation features are not yet implemented.

Innovation Component of the Project

The innovative aspect of **News Forge** lies in combining **Artificial Intelligence, live web search, and workflow automation** into a single intelligent pipeline. Unlike conventional news aggregators that simply collect headlines, News Forge evaluates the relevance and impact of news articles using Large Language Models before generating concise summaries.

Key innovations include:

AI-powered intelligent news curation instead of simple keyword aggregation.

Modular PocketFlow pipeline architecture for scalable and maintainable workflow automation.

History-based duplicate detection to prevent repeated news across newsletters.

LLM-generated summaries that explain why each news item is important.

Customizable topic selection, allowing users to generate newsletters based on their interests.

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

Zero-database architecture, making the application lightweight, portable, and easy to deploy.

These innovations demonstrate the practical application of Generative AI and intelligent automation to solve the real-world problem of information overload while significantly improving productivity and knowledge discovery.

Project Objectives

Project Objectives

The primary objective of **News Forge – AI Newsletter Engine** is to develop an intelligent, AI-powered system that automates the collection, filtering, summarization, and presentation of the latest Artificial Intelligence news. The project aims to minimize the time users spend searching for relevant information while ensuring that only high-quality and impactful news is delivered.

The specific objectives of the project are:

- To automate the collection of real-time AI news from multiple online sources.
- To filter duplicate, outdated, and less relevant news articles using AI-based selection techniques.
- To generate concise, informative, and easy-to-understand summaries using Large Language Models (LLMs).
- To create a structured and professional AI newsletter in Markdown format.
- To support customizable news topics based on user interests.
- To maintain a history of previously covered news and avoid repetition in future newsletters.
- To demonstrate the practical application of Generative AI, workflow automation, and natural language processing in solving real-world information overload.
- To build a lightweight, modular, and scalable system using the PocketFlow framework that can be enhanced with additional features in the future.

Expected Outcomes and Deliverables

At the completion of the project, the following outcomes and deliverables are expected:

Expected Outcomes

- Automated generation of AI newsletters containing the latest and most relevant news.
- Significant reduction in the manual effort required to stay updated with AI developments.
- Improved productivity by delivering concise, high-quality summaries instead of raw news articles.
- A scalable AI workflow demonstrating intelligent news curation using Large Language Models.

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

- Enhanced understanding of AI pipeline development, prompt engineering, and workflow automation.

Project Deliverables

- A fully functional ****News Forge – AI Newsletter Engine**** application.
- Modular PocketFlow pipeline consisting of:
 - CurateSources
 - FilterStories
 - SummarizeStories
 - FormatNewsletter
- Source code developed in Python.
- Integration with DuckDuckGo Search (DDGS) for live news retrieval.
- Integration with Google Gemini/OpenAI APIs for AI-powered filtering and summarization.
- History management using `history.json` to prevent duplicate news.
- Automatically generated AI Weekly Digest in Markdown format.
- Project documentation, GitHub repository, and user guide for installation and execution.

These objectives and deliverables ensure that the project successfully addresses the problem of information overload while showcasing the effective use of Artificial Intelligence and automation in real-world applications.

Methodology and Results

Methods and Technologies Used

The **News Forge – AI Newsletter Engine** follows a modular AI workflow to automate the process of collecting, filtering, summarizing, and formatting AI news into a professional newsletter. The project is implemented using Python and the PocketFlow framework, where each stage of the workflow is represented as an independent processing node.

The methodology consists of the following steps:

1. News Collection

- The system searches the web for predefined or user-defined AI topics using DuckDuckGo Search (DDGS).
- Relevant news articles are collected with their titles, URLs, and snippets.

2. Story Filtering

- Previously covered articles are identified using a local history.json file.
- A Large Language Model (Gemini/OpenAI) evaluates the collected articles and selects the most relevant and impactful stories.

3. News Summarization

- The selected articles are summarized into short, easy-to-understand descriptions using Large Language Models.
- The summaries explain why each news item is important for readers.

4. Newsletter Generation

- The summarized stories are formatted into a structured Markdown newsletter.
 - The final output presents a professional AI Weekly Digest that can be easily shared or exported.
-

Tools and Software Used

Tool / Software	Purpose
Python 3.x	Core programming language
PocketFlow	Workflow orchestration using modular nodes
Google Gemini API	AI-powered news filtering and summarization
OpenAI API (Fallback)	Backup LLM when Gemini is unavailable
DuckDuckGo Search (DDGS)	Real-time web search without API keys
PyYAML	Parses structured YAML responses from the LLM
python-dotenv	Secure loading of API keys from .env files
VS Code	Development environment
Git & GitHub	Version control and project hosting
Markdown	Newsletter output formatting

Data Collection Approach

The project does not rely on a traditional database or pre-collected dataset. Instead, it gathers **live information directly from the web**.

The data collection process includes:

- User provides default or custom AI-related topics.
- DuckDuckGo Search retrieves the latest news articles.
- Each search result contains:
 - News Title
 - URL
 - Short Description (Snippet)
- The collected news is passed to the AI model for evaluation.
- Selected stories are stored in a local history.json file to avoid duplication in future newsletters.

This real-time approach ensures that every generated newsletter contains current and relevant information.

Project Architecture

The project follows a **linear node-based architecture** built using the **PocketFlow** framework.

Architecture Flow

Architecture Description

CurateSources

- Searches the web for multiple AI-related topics.
- Retrieves article titles, URLs, and snippets.
- Stores raw news in a shared workflow object.

FilterStories

- Reads previously covered news from history.json.
- Uses the Gemini/OpenAI LLM to select the four most relevant stories.
- Eliminates duplicate news.

SummarizeStories

- Generates concise 2–3 sentence summaries.
- Explains why each news article is important.

FormatNewsletter

- Formats all summaries into a clean Markdown newsletter.
- Produces the final AI Weekly Digest.

Final Project Working Screenshots

Note: Replace the placeholders below with actual screenshots captured during project execution.

Results

The implementation of **News Forge – AI Newsletter Engine** successfully achieved the intended objectives. The application automatically collects the latest AI news, filters duplicate and low-value stories, generates concise summaries using Large Language Models, and formats the results into a professional AI newsletter. By automating the complete workflow, the project significantly reduces the manual effort required to stay updated with AI developments while improving the relevance and quality of the information presented. The modular PocketFlow architecture also ensures that the system is scalable, maintainable, and ready for future enhancements such as email delivery, personalized newsletters, and semantic duplicate detection.

Social / Industry Relevance of the Project

Social / Industry Relevance of the Project

The **News Forge – AI Newsletter Engine** addresses a real-world challenge faced by professionals, researchers, students, startups, and organizations working in the rapidly evolving field of Artificial Intelligence. With hundreds of AI-related research papers, product launches, open-source projects, funding announcements, and technical articles published every day, it has become increasingly difficult to stay informed without investing significant time in manual research. This project automates the entire process of discovering, filtering, summarizing, and presenting relevant AI news, thereby improving productivity and enabling users to focus on learning and decision-making rather than information gathering.

From an **industry perspective**, the project demonstrates the practical application of **Generative AI, Large Language Models (LLMs), Natural Language Processing (NLP), and workflow automation** in solving the problem of information overload. The modular architecture built using the PocketFlow framework makes the solution scalable, maintainable, and suitable for integration into enterprise knowledge management systems, corporate research platforms, and technology news services. Organizations can adapt the same approach to monitor industry trends, competitor activities, market intelligence, and technological innovations across various domains.

The project also has significant **social relevance**, particularly for students, educators, researchers, and lifelong learners. By providing concise, easy-to-understand summaries of complex AI developments, News Forge makes advanced technological information more accessible to a wider audience. It promotes continuous learning, supports skill development, and helps bridge the knowledge gap between rapidly evolving technologies and the people who need to understand them. This contributes to building a more informed and technologically aware society.

Furthermore, the project aligns with the growing adoption of AI-powered productivity tools across industries. The techniques implemented in News Forge—including intelligent content curation, duplicate detection, automated summarization, and structured report generation—can be extended to domains such as healthcare, finance, cybersecurity, education, legal services, and scientific research. This demonstrates the project's versatility and highlights its potential for real-world deployment beyond AI news aggregation.

Overall, **News Forge** showcases how Artificial Intelligence can be effectively used to automate repetitive knowledge-intensive tasks, improve information accessibility, support faster decision-making, and enhance productivity. The project serves as a practical example of applying AI technologies to create solutions with meaningful social impact and strong industrial relevance.

Learning & Reflection

Learning and Reflection

Team Member's New Learnings

During the development of **News Forge – AI Newsletter Engine**, the project team gained valuable technical and professional knowledge through hands-on implementation. The project provided practical exposure to modern Artificial Intelligence technologies, software development practices, and collaborative project execution.

Technical Learnings

- Gained practical experience in developing AI-powered applications using **Python**.
- Learned to design modular workflows using the **PocketFlow** framework.
- Understood the integration and effective use of **Large Language Models (LLMs)** such as Google Gemini and OpenAI APIs.
- Learned prompt engineering techniques to obtain structured and reliable responses from AI models.
- Implemented real-time web search using the **DuckDuckGo Search (DDGS)** library.
- Learned to process structured AI responses using **PyYAML**.
- Developed skills in handling API integration, exception handling, and configuration management using `.env` files.
- Understood the importance of modular software architecture, reusable components, and clean code practices.
- Gained practical experience with **Git and GitHub** for version control and project management.
- Improved debugging, testing, and troubleshooting skills while developing the application.

Management and Professional Learnings

- Improved project planning and task management through systematic development.
- Learned the importance of requirement analysis before implementation.
- Enhanced problem-solving and analytical thinking while designing AI workflows.
- Improved technical documentation and report writing skills.
- Developed better communication and collaboration skills during project discussions and reviews.

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

- Understood the significance of building scalable and maintainable software solutions.
-

Overall Experience

Working on **News Forge – AI Newsletter Engine** was a valuable learning experience that provided practical exposure to real-world AI application development. The project allowed us to move beyond theoretical concepts and apply our knowledge to solve an actual industry problem—information overload.

One of the most rewarding aspects of the project was integrating multiple technologies into a single workflow. Designing the PocketFlow pipeline, connecting live web search with Large Language Models, and generating automated newsletters helped us understand how modern AI systems are built and deployed. Throughout the development process, we encountered challenges such as API integration, handling structured AI responses, avoiding duplicate news, and designing an efficient workflow. Solving these challenges improved our technical confidence and strengthened our problem-solving abilities.

The project also enhanced our understanding of software engineering principles, including modular architecture, code organization, testing, and documentation. We gained confidence in using AI development tools and learned how workflow automation can significantly improve productivity in real-world applications.

Overall, this project was an enriching experience that strengthened our technical knowledge, practical development skills, and professional confidence. It has prepared us to undertake more advanced AI and software engineering projects while demonstrating the real-world potential of Generative AI and intelligent automation.

Conclusion and Future Scope

Future Scope and Conclusion

Future Scope

Although the current implementation successfully meets the project objectives, several enhancements can further improve its functionality, scalability, and user experience.

The future scope of the project includes:

- Developing a **web-based dashboard** for easier access and management of newsletters.
- Implementing **user authentication** and personalized profiles.
- Allowing users to subscribe to **custom topics** and receive personalized newsletters.
- Supporting **email delivery** and scheduled newsletter generation.
- Adding **PDF, HTML, and mobile-friendly** export options.
- Integrating additional news sources such as **arXiv, GitHub Trending, Hacker News, Reddit, and RSS feeds**.
- Implementing **semantic duplicate detection** using vector embeddings to identify similar news articles beyond simple URL matching.
- Supporting multiple categories such as **Cybersecurity, Cloud Computing, Data Science, Finance, Healthcare, and Business Technology**.
- Providing multilingual newsletter generation using advanced Large Language Models.
- Developing analytics dashboards to track trending topics, news frequency, and user engagement.
- Deploying the application on cloud platforms for public access and scalability.
- Building a mobile application with push notifications for real-time AI news updates.

With these enhancements, **News Forge** can evolve from a project prototype into a fully functional AI-powered news intelligence platform capable of serving individuals, educational institutions, research organizations, startups, and enterprises. The project establishes a strong foundation for future innovation in automated knowledge discovery, intelligent content curation, and AI-driven information management.

Conclusion

The **News Forge – AI Newsletter Engine** successfully achieved its primary objective of automating the process of discovering, filtering, summarizing, and presenting the latest Artificial Intelligence news. The project demonstrates how **Artificial Intelligence, Large Language Models (LLMs),**

workflow automation, and real-time web search can be integrated into a single intelligent system to solve the problem of information overload.

By leveraging the **PocketFlow** framework, the application follows a modular and scalable architecture that enables efficient processing of news through multiple stages, including live data collection, AI-based story selection, automatic summarization, and newsletter generation. The system significantly reduces the time and effort required to stay updated with the rapidly changing AI landscape while providing users with concise, relevant, and high-quality information.

The project also provided valuable practical experience in AI application development, API integration, prompt engineering, workflow automation, and software engineering best practices. Overall, **News Forge** demonstrates the potential of Generative AI to automate knowledge-intensive tasks and improve productivity for professionals, researchers, students, and organizations.
